

Cybercrime-Case Study -UPI Fraud:

UPI fraud is a common type of cybercrime that is increasing rapidly with the growing use of digital payment apps. In this type of fraud, attackers try to trick people into sending money through UPI by creating confusion.

For example, a student may receive a call from a scammer who pretends to be a buyer or a company representative. The scammer says that he wants to send money and sends a payment request on a UPI app. He then asks the student to enter their UPI PIN to receive the money.

However, this is a trick. When the student enters the PIN, the money actually gets deducted from their account instead of being received.

This type of fraud mainly targets students and people who are not fully aware of how UPI systems work. Many people assume that entering the PIN is required to receive money, which is not true. As a result, they end up losing money.

To stay safe, we should always remember that UPI

PIN is only used to send money, not to receive it.
We should avoid accepting requests from
unknown people and always verify before making
any transaction.
